SHRIJEE FLUIDIZED BED SUGAR DRYER (FBD)

Fluidized bed dryer is an equipment used widely in the sugar industry to reduce the moisture content of sugar discharged from centrifugals. The equipment works on a principle of fluidization of the feed materials. In fluidization process, hot air is introduced through a perforated bed of moist solid particulate. The wet solids are lifted from the bottom and suspended in a stream of air (called fluidization). Heat transfer is accomplished by direct contact between the wet solids and hot gases. The vaporized liquid is carried away by the drying gasses. Shrijee FBD is stationary equipment ranging in capacity from 15T/hr to 60T/hr along with dust catching system.

ADVANTAGES OF FBD

- Intimate contact of hot air and solids result in high heat transfer co-efficient. This makes the drying system compact
- Unique and thermally efficient design of embedded Heat Exchanger
- Lower capital costs
- No Moving parts, stabilized operation and negligible maintenance
- Moisture reduction from 1.0% to 0.03-0.05%
- Sugar temperature is close to wet bulb temperature of air. This allows gentle drying without Caramelization of sugar
- The gentle drying and cooling process brings an excellent product quality
- Efficient dust catching system
